CARE AND MAINTENANCE
• Flush each lumen with 10 ml of saline using a 10 ml or larger syringe.
• Do not use excess pressure to flush.
• When injecting or infusing incompatible medications, always flush catheter with at least 10 ml saline before and after each medication.
• Use “positive pressure disconnect” - always remove syringes slowly while injecting saline. Leave 0.5 ml of saline in the syringe (do not bottom out the syringe).
• Aspiration Difficulties - If no resistance to infusion is felt, attempt to flush with 10 ml normal saline. Pull back gently on syringe plunger 0.5 ml, pause, then proceed with aspiration.
• Allow all cleaning agents / antiseptics to dry completely before applying dressing.
